

Third-Party Cyber Risk Management

Third-Party cyber risk is your enterprise cyber risk.

Organizations no longer exist as single entities, but as a network of interconnected partnerships. While this offers a deep and highly effective supply chain, it also poses a serious challenge when trying to manage cyber risk.

Third-parties are one of the biggest threat vectors because of the unique set of challenges they present. These include:

- Different types of systems integration
- Dynamic asset and network environments
- Multiple processes to evaluate
- Varying compliance requirements
- Communication around issues
- Constant change at both parties

Gain Visibility to Effectively Manage the Complexities of Third-Party Cyber Risk

Accurate Discovery and Visibility

We provide immediate visibility by discovering an organization's third parties and identifying the systems that service your company, and their security exposure levels. We conduct real-time attack surface assessments in conjunction with auto-validated questionnaires for a 360-degree view of risk. This provides you with timely detection of your exposed third-party assets which can be prioritized for more focused and collaborative remediation.

Customizable Risk Score Modeling

Our patented technology for risk score modeling enables you to see beyond traditional risk ratings and scale the weighting of specific risk scoring criteria related to a group of, or specific third parties.

Fostering Collaboration

Communicate risk vulnerability tasks with your third parties through our platform and validate the remediation efforts to see the updates in the benchmark score for the affected third parties. FortifyData provides an integrated collaboration module that lets you work with your third parties to assign tasks, evaluate custom requirements and have certified cyber risk professionals validate resolved issues. Additionally, this cyber risk identification can be extended to fourth parties and beyond to create a "network effect" that will further reduce your risk.

Continuously Monitor Their Risks

FortifyData enables you to evaluate prospective vendors to understand data sharing risks, business continuity concerns and their overall cyber hygiene. For existing vendors, you can continuously monitor their evolving attack surface and compliance with your third-party risk management program.

60%

Forrester's recent 2022 predictions identified that "Sixty percent of security incidents will result from issues with third parties. Forrester data reveals that 55% of security pros reported their organization experienced an incident or breach involving supply chain or third-party providers in the past 12 months."

Core Capabilities

Accurate Auto-Asset Discovery

Reduce asset misattributions with FortifyData's auto asset discovery capability. While other solutions can take up to 4 months to update new asset

inventory, we continuously search and identify new assets on a weekly basis.

Infrastructure Security Assessment

We conduct full and continuous vulnerability assessments of your internal and external infrastructure. These non-intrusive scans

send transmissions to the network's nodes, uncovering weaknesses. This assessment provides insight on a company's infrastructure security risks, allowing you to quickly and accurately identify, investigate and prioritize.

Data Accuracy

FortifyData collects data through both active and passive assessment methodologies, not relying on historical,

OSINT data. We continuously re-assess to make sure all attack surface data is timely and accurate.

Cloud Configuration

Dynamic technologies and processes can lead to inadvertent changes and exposures affecting your cloud security posture.

FortifyData will monitor your cloud for misconfigurations and opportunities for hardening, and we provide actionable recommendations to continuously improve your cloud security posture.

Dark Web Intelligence

Our proprietary intelligence feeds alert clients when data has been compromised, either within your organization or through a third-party entity. Through continuous dark/deep

web scanning of files and databases across social media, un-indexed and transient deep websites, we will alert you of exposed company records, including leaked information, stolen credentials and confidential documents.

Human Risk Factor

Through our automated phishing simulations and progress tracking, we assess the susceptibility of your workforce to cyber

attacks. In addition, we help train your workforce to improve security awareness throughout your organization.
